<center>Programming Assignment 05</center>

This programming assignment is incomplete because I had many issues with getting the simulation to work with the rest of my implementation. I restarted multiple times in hopes of simplifying what I was doing, but I couldn't find a valid solution for the simulation. In this current version I do not have a priority queue so I was planning on using two queues, one for arrivals and one for departures. The arrival queue already contains the Client objects sorted by arrival time, I was having issues trying to implement the departure queue and the bank line.
